

REFACTORING STANDARD FORM FACTORY INPUTS

FORM FACTORY V2

There is no need to do any refactoring for the default inputs you just need to deploy **form-factory-basic-layout** module as described below. You can clone the module from here: <https://github.com/Jahia/form-factory-basic-layout.git>

- Deploy the **form-factory-basic-layout** module and then add it (deploy it) to your site. Type `mvn -P <your profile here> clean install jahia:deploy` in console and press return. Assuming that you have a website with Form Factory deployed on it (if not create one), go to *Web Projects* and click on *Edit site* button. Now click on *Choose modules to be deployed*, check **form-factory-basic-layout** module and click *Next*. You can verify results by going to edit mode. Observe that all the labels appear above inputs.

But feel free to modify input layouts as you see fit in the **form-factory-basic-layout**.
