

## Using Image Checkboxes

In this guide I will walk you through the functionality of checkbox images, explain its features and teach you how to set up your own image checkbox input.

### Add input to your form

To add image checkbox to your form open the side panel by pressing the “Add element” button and then select “Image checkbox”

### Using bootstrap grid system

Image checkboxes are displayed using bootstrap grid system. The way it works is you specify the size of device (large, medium, small) and then you specify the number of columns you want to be displayed in a row on that device size. Once device size gets smaller than the specified target size bootstrap will display all images in one column. Finding a target size can be a little tricky and will depend on the number of checkboxes you have and their sizes. One thing you should do is hide the site settings panel so that your inputs are displayed in full width.

You can customize the wrapping div's col class using selectors below. For more info see Bootstrap Grid System You may want also want to hide the settings panel on the left for better display accuracy.

Bootstrap col size (i. e. col-md-12)

md

Bootstrap col number (12 / col number = number of columns per row)

4

You should note that “Bootstrap col number” doesn’t specify the number of columns but the number in the bootstrap’s col class (i. e. col-md-4). To get the actual number of columns you need to divide twelve by the col number. For example for col number 4 you would get  $12 / 4 = 3$  columns.

## Using key-value pairs

The key-value pair is similar to key-value pairs used in regular checkbox inputs but offers you additional functionality. You should specify a key and a value the value will be displayed in results just like it is with a regular checkbox input.

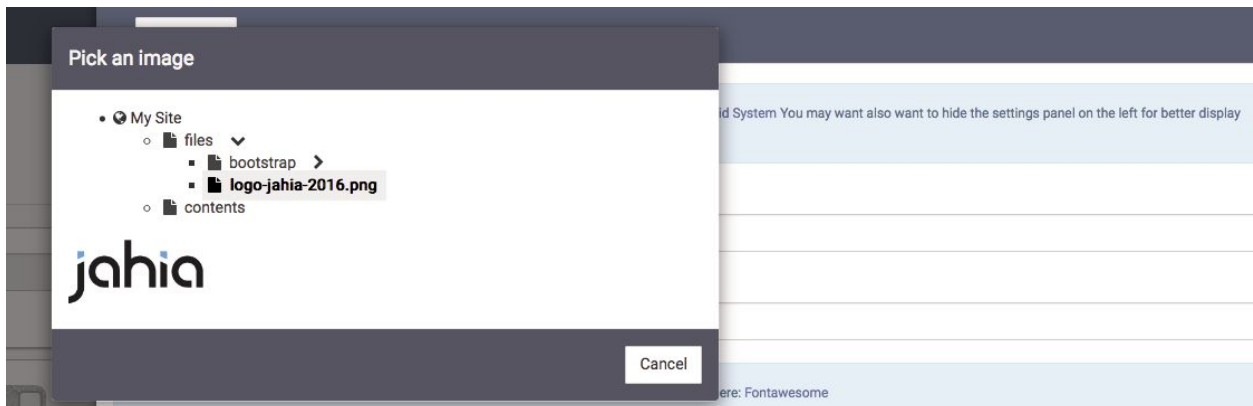

To see additional functionality click on the chevron on the right side of the key-value pair.

The screenshot shows a configuration interface for a key-value pair. At the top right, there are buttons for '+ Add' and 'Sort'. Below these, there are two main input fields: 'Key:' and 'Value:'. The 'Key:' field contains the text 'checkboxone'. The 'Value:' field contains the text 'Check box one'. To the right of the 'Value:' field are three small icons: an up arrow, a down arrow, and a trash can. Below these fields is a chevron icon pointing downwards. Underneath the chevron, there are two more input fields: 'Image:' and 'Popup text or html:'. The 'Image:' field contains the URL '/files/live/modules/form-factory-extended-inputs/1.0/templates' and has a small image icon to its right. Below the 'Image:' field is a small square image with a brown and orange pattern. The 'Popup text or html:' field contains the code '<i class="fa fa-hand-pointer-o fa-2x">'. Below this field is a 'Size:' dropdown menu with 'large' selected.

You can specify image url by typing or picking one from your site, you can provide popup text or html and modify checkbox size.

If you want to pick image from your site's folder click on the image icon next to the image url to see image picker. Navigate your site's folder structure to locate desired image and then click on that image.

To close the panel with additional functionality click on the chevron area again.
